1. Claims 1-38 are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 1-38 are drawn to methods and kits for “screening *in vivo*” and screening *in vitro*” for signal transduction modulators for a G-protein coupled receptor. The steps of the method, however, recite detecting modulation of RDGC GPCR phosphatase activity. It is unclear whether this is a screen for modulation of the phosphatase activity or signal transduction. Amendment is requested to either change the preamble to recite phosphatase modulation or to add a step explaining how the modulation of phosphatase is interpreted to determine modulation of signal transduction

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-38 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Vinós et al., Science, 277:687-690, 8/1/996 (Vinós).

4. Vinós teaches a method of *in vivo* and *in vitro* modulation of the RDGC phosphatase activity. (Fig. 1, Panel B, for example). The claimed “compound suspected of having modulation activity” reads on the rdgC mutants which modulate phosphatase activity. See for example Fig. 3,

Art Unit 1656

caption. The claims differ from the prior art in the recitation of "screening" and methods of modulation.

It would, however, have been *prima facie* obvious to one of ordinary skill in the art at the time the invention was made to interpret the deactivation taught by Vinós as "modulation" because, modulation is defined in the specification "the invention includes . . . defective GPCR phosphatases."
